Overview

The aim of our work is to efficiently allocate donated funds to the poor, with the end goal of lifting them out of poverty.

The problem

Resource allocation is an important problem in economics that has been studied extensively over time. It is especially important in a country like Nigeria, that is ravaged by inequality, poverty, and has been proven time and again to be non-accountable with funds.

Some problems with existing systems are:

- a. Fraud and trafficking
- b. Voluntary stay in grant schemes by participants
- c. Cash siphoning
- d. Mis-reporting of needs by participants

Proposed solution

We propose a multi-sided platform using community-led and crowdsourcing approach to connects three entities. The donor, reputable organizations/service providers, and poor individuals.
